Work on a £650m biomass energy plant on Teesside started in September 2017. MGT Power finalised funding for its Tees Renewable Energy Plant and the factory, at Teesport between Redcar and Middlesbrough, will be one the world’s largest biomass power stations, providing electricity for 600,000 homes by burning wood chips and pellets imported mainly from the US.
Graham Construction won the contract to construct the Energy Plant. Tracey Concrete were selected as supplier as all the precast drainage on the project. Assessing the drainage CAD drawings of the project, a complete drainage product take-off was completed using our Perfect Base™ and Watertight Manhole system.
